

L100 series Smart Lock

The perfect combination of fashionable appearance and modern, intelligent technology.

Fingerprint

Password

RFID Card

Sleek design, comfortable keypad
Durable zinc alloy body
Unique BioNANO fingerprint algorithm
High capacity storage for fingerprints, ID and cards
Offers you simple and safe solutions

Safe and Convenient

Forgot or lost your key? In a hurry?
Can't remember your password?

L100 offers maximum convenience by simply applying a fingerprint. You'll never need to search your pockets or purse for your keys again.

User-friendly design Easy installation

The reversible handle ensures you can replace the old lock in one step.

Considerate Design

Ergonomically-designed, the keypad is produced with shallow grooves. A simple and semi-transparent keypad design allows for easy operation at night.

Optional handle

The optional handle provides for two distinct door handle styles.

Prevention of violent break

When the device is locked, the handle can be turned. However, the door will remain locked. This is crucial for the prevention of a forcible entry. Other door-locking devices have handles that maintain a rigid position when locked. Blunt force can be used to break the lock and open the door. The L100 has solved this problem.

Electroplating technology

The durable zinc alloy body passed a 72-hour salt-spray, fog corrosion test. Very suitable for environments which are in contact with corrosive material such as hotels located by the ocean, or industrial production zones.

Low power consumption

Complete with energy efficient technology. Low energy-consumption chips substantially extend the lifespan of the battery. Two additional forms of energy conservation are built-in: Infrared light sensitization, and function keycard activation. These features ensure that while the identity verification portion of the device is inactive, it remains in a power conservation mode.

Always-open mode

When you host a social event, people frequently enter and exit the premise, this can be inconvenient. You can set the lock to "always-open" mode. In this case, ID certification is not required. Enjoy your party!

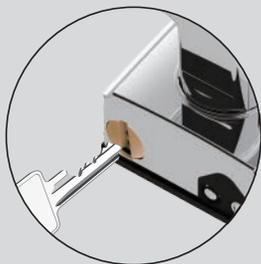

Low-voltage alarm

Light and sound indicators provide two ways to notify you that the L100 has a low battery. A door can still be opened 500 times once you are notified of a low battery. This gives you enough time to change the battery.

Emergency Door Unlocking

When the batteries are completely discharged, you can easily supply emergency power to the lock with the standard 9V battery. Also there is a Mechanical key for you to open the door.

Safe password

A unique security code can be entered when your fingerprint can't be provided. The keypad will automatically lock for 12 seconds if the password is incorrectly entered three times. The locking time will be even longer if the improper code is input again.

User management

Manage through the hardware: Work directly through the device interface: register, and add or delete appointed people.

Anviz fingerprint algorithm and module

A unique Anviz BioNANO algorithm that automatically accounts for the broken lines in fingerprint images, and rapidly and precisely verifies dry or wet fingerprints. Optical fingerprint sensor is scratch-proof and durable.

Fingerprint Algorithm

1. Suitable for both wet and dry fingers.
2. Automatically accounts for broken lines in fingerprint images.
3. Can extract features in worn fingerprints.
4. Auto-updates fingerprint templates.

Optical Fingerprint Sensor

1. A viewable surface area is increased to 22x18mm thanks to the larger image capture window.
2. High-quality optical imaging glass creates improved image quality.
3. Antireflective and wear resistant plate enhances durability.
4. Fully sealed sensor for weather resistance and durability
